*Rhizopogon* is a hypogeous fungal genus that grows in an ectomycorrhizal symbiosis mostly with members of the *Pinaceae* family and its worldwide distribution correlates with natural and exotic *Pinaceae* forests. In Iran, *Rhizopogon* species have received scant attention from collectors in the past and have not been adequately collected. Few older studies, report the presence of *R. luteolus* (Saber 1999), and *R. vulgaris* in Iran (Ershad 2009). However, the accuracy of the species identification merely on the basis of morphological features is questionable. *Rhizopogon roseolus* is common in northwestern United States USA (Coker & Couch 1928, Harrison & Smith 1968). So far, it has been reported from, Finland (Schulmann 1955), Chile (Garrido 1986), Brazil (Baseia & Milanez 2002), Poland (Iwanski *et al.* 2006), Spain (Dominguez-Nunez *et al.* 2013) and New Zealand. In this study, seven specimens associated with roots of *Pinus eldarica* based on morphological and molecular characteristics were examined. Basidiocarps were hypogeous, globose, subglobose or irregular with different sizes (up to 10 cm in diam.) (Fig. 1A). Peridium was smooth and orange. Gleba was white to olive (Fig. 1B). Fresh mature basidiocarp not reacting in iodine. The basidia were club-shaped and 15–20 × 6–8 µm (Fig. 1C). Columella absent and paraphyses about 12–18 × 5–9 µm (Fig. 1D). The basidiospores ellipsoidal, smooth, hyaline, 6–8 × 3–4 µm, often contain two guttulae inside and falsely septate (Fig. 1E). All DNA sequences of *Rhizopogon* (accession numbers: KP202698 to KP202700) showed 100% homology with valid sequences previously identified and deposited in GenBank. Phylogenetic trees constructed based on ITS sequences showed that, all Iranian specimens are in the same branch in a clade with *R. roseolus* reported from other authors (Fig. 2). *Rhizopogon roseolus*, *R. Burlinghamii*, and *R. vulgaris* form distinct clades which were well-supported by bootstrap value (78% MP). This is the first report of *R. roseolus* and its host plant from Iran.

Voucher specimens are deposited in the Culture Collection of the Ministry of Jihad-e-Agriculture ("IRAN") located at the Iranian Research Institute of Plant Protection, Tehran, Iran (IRAN-16730F).

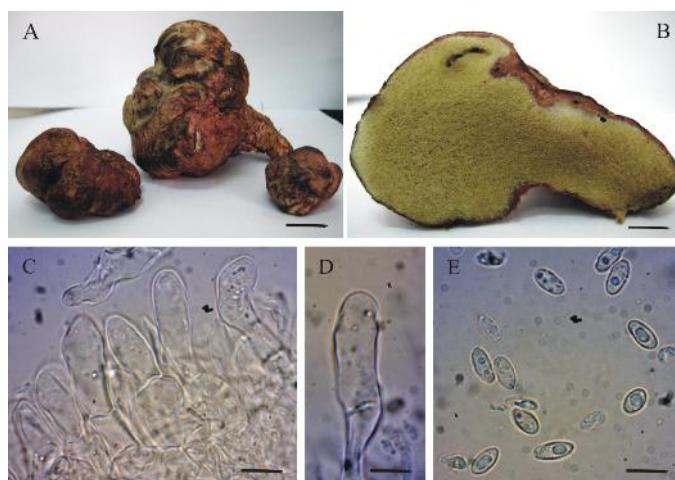

Fig. 1. *Rhizopogon roseolus*: A. Basidiocarp in different size, B. Cross section of basidiocarp, C, D. Basidium and Paraphysse, E. Basidiospores (Bars = 1 cm in A, B and 10 µm in C-E).

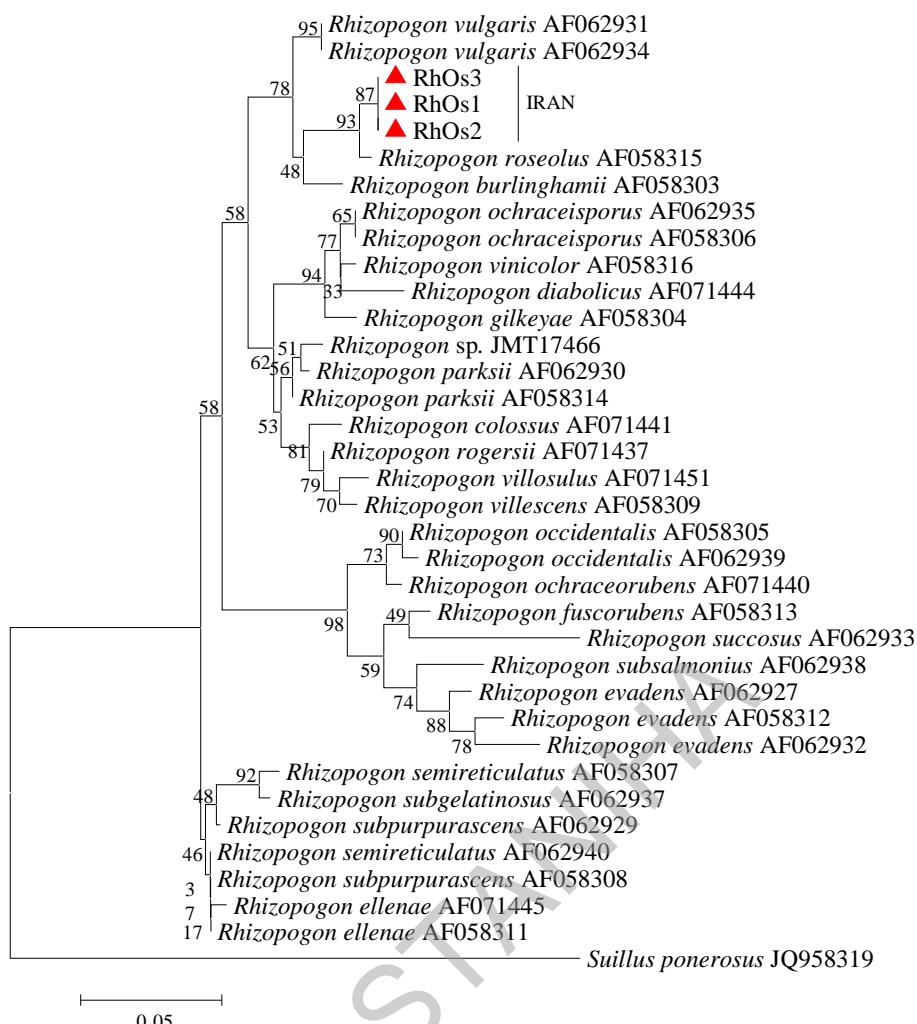

Fig. 2. Maximal Parsimony phylogram generated in Mega from the alignment of 36 combined ITS1, 5.8S subunit, and ITS2 regions of the genomic ribosomal RNA sequences of *Rhizopogon* species using Kimura 2 parameter method (Kimura 1980) with complete deletion gap handling and 1000-replication bootstrapping. The triangles refer to *Rhizopogon roseolus* specimens in Iran.

نخستین گزارش از *Rhizopogon roseolus* در ایران

د. رفعت: ١٣٩٨/٨/٢٢ / نبذة ش: ١٣٩٨/٨/٨

خلاصه

*Rhizopogon* یک قارچ زیرزمینی است که به صورت قارچ-ریشه خارجی در همزیستی با اغلب اعضای تیره کاج (Pinaceae) بوده و پراکنش جهانی آن همسو با جنگل‌های کاج است. در ایران، مطالعات کمی در خصوص *Rhizopogon* صورت گرفته و اطلاعات اندکی در مورد این قارچ در دسترس است. در مطالعه حاضر، هفت نمونه *Rhizopogon* که همراه با ریشه گونه گیاهی *Pinus eldarica* بودند، براساس خصوصیات مورفولوژیکی و مولکولی مورد بررسی قرار گرفتند. بر این اساس، تمام نمونه‌های دنبیل دروغین *Rhizopogon* همراه با ریشه این گونه گیاهی متعلق به جنس *Rhizopogon* بودند. توالی دی.ان.ای. نمونه‌های *Rhizopogon* ۱۰۰ درصد همولوژی با نمونه‌های معتبر ثبت شده در بانک ژن داشتند. درخت فیلوژنتیکی ترسیم شده براساس توالی‌های جداکننده نسخه‌برداری شده داخلی (آی.تی.اس)، نشان داد که تمام نمونه‌های تحت بررسی با نمونه‌های معتبر مربوط به گونه *Rhizopogon roseolus* در یک شاخه با ضریب اطمینان بالا قرار گرفتند. این نخستین گزارش از وجود این گونه و میزان آن در ایران است.
