Abstract

Caryophyllaceae is the fifth largest Iranian plant family in terms of number of species where most of its species are Irano-Turanian. About 30% of these species are endemic of Iran. There are continuously uncertainties regarding the circumscription of genera, and especially because of new molecular and phylogenetic studies that in many cases do not confirm the traditional generic circumscription, the need for tangible traits to distinguish between the genera is felt. Accordingly, in this study, leaves' anatomical characteristics of some species of *Caryophylloideae* from Iran have been described. Forty-nine characters (including 16 qualitative and 33 quantitative characters) of leaves' transverse sections and epidermis have been considered. No anatomical characteristics are constant in all species of the genera, but some of them such as stomatal patterns, limb symmetry, collenchymatous tissue and layers of fiber around the central vascular bundles may be useful to separate some genera. Contemplating morphological and anatomical features, two new combinations and a key for the genera of this subfamily in Iran have been provided. *Psammophiliella* has been recorded for the first time from Iran.

Keywords: *Caryophyllaceae*, new combination, *Petrorhagia*, *Psammophiliella*, qualitative and quantitative characters

خلاصه

تیره میخکیان پنجمین تیره بزرگ ایران از نظر تعداد گونه است که غالب گونه‌های آن پراکنش ایرانو-تورانی دارند. حدود ۳۰٪ گونه‌های این تیره انحصاری کشور ایران هستند. پیوسته ابهاماتی در تعیین حدود جنس‌های میخکیان وجود داشته و به خصوص براساس مطالعات مولکولی و تبارشناختی جدید که در بسیاری موارد حدود سنتی جنس‌ها را تایید نمی‌کنند، لزوم یافتن صفات ملموسی برای تشخیص جنس‌ها از یکدیگر احساس می‌شود. بر این اساس در این پژوهش، خصوصیات تشریحی برگ برخی گونه‌های ایرانی زیرتیره کاریوفیلوبیده شرح داده شده است. چهل و نه صفت (شامل ۱۶ صفت کیفی و ۳۳ صفت کمی) برش عرضی و اپیدرم برگ‌ها مورد مطالعه قرار گرفته است. همه صفات تشریحی در بین گونه‌های بررسی شده یک جنس ثابت نیستند، ولی بعضی از آن‌ها مانند الگوی روزنه‌ها، تقارن پهنک، وجود بافت کلانشیم و وجود لایه‌های فیبر در اطراف دسته آوندی مرکزی، می‌توانند در جدایی برخی جنس‌ها مفید باشند. با توجه به صفات ریخت‌شناختی و تشریحی، دو ترکیب جدید آرایه‌شناختی و کلید شناسایی برای جنس‌های این زیرتیره در ایران تهیه شده و جنس *Psammophiliella* برای نخستین بار از ایران گزارش شده است.

واژه‌های کلیدی: پترورازیا، پساموفیلیا، ترکیب جدید، صفات کیفی و کمی، میخکیان

Introduction

Caryophyllaceae Juss. is a large and cosmopolitan flowering plant family; however, the systematic of many of its taxa has been ambiguous, due to a lack of definite morphology and complete matching of morphological and molecular studies' results (Greenberg & Donoghue 2011, Madhani et al. 2018). As a matter of fact, floral features such as calyx characters and the number of styles are very important in circumscription of taxa in *Caryophyllaceae*. (Boissier 1867, Schischkin 1936, Rechinger 1988) However, in delimitation of some genera like *Saponaria* L., and *Silene* L. some of these characters sometimes have been neglected. For instance, in spite of their difference in the number of styles and capsule teeth, *Lychnis* L. has been mentioned as a synonym for *Silene* in Flora Iranica (Melzheimer 1988) and many researchers have put various sets of taxa in *Saponaria* (Barkodah 1962, Rechinger 1988).

The subfamily *Caryophylloideae* Rabeler & Bittrich with nearly 240 species comprises about 3% of angiosperms' flora of Iran (Ghahremanejad et al. 2017). *Caryophylloideae* includes *Acanthophyllum* C.A.Mey., *Agrostemma* L., *Allocrusa* Bunge ex Boiss., *Ankyropetalum* Fenzl, *Dianthus* L., *Diaphanoptera* Rech.f., *Gypsophila* L., *Petrorhagia* Link, *Psammophiliella* Ikonn., *Saponaria*, *Silene*, *Vaccaria* Wolf, and *Velezia* L. in Iran. *Silene* with around 117 species (Gholipour & Sheidai 2009, Nejati Edalatiyan et al. 2010, 2011, Gholipour & Parsa Khanghah 2015, Gholipour et al. 2016, Hoseini & Assadi 2016, Gholipour 2017, Gholipour & Aminrad 2017, Nejati Edalatiyan et al. 2017, Gholipour 2018), *Dianthus* with nearby 38 species (Assadi 1985, Rechinger 1988, Vaezi et al. 2014), *Gypsophila* with 38 species (Nejad Falatoury et al. 2015a, b, 2016a, b, c, Nejad Falatoury & Assadi 2018), and *Acanthophyllum* (Basiri Esfahani et al. 2011, Mahmoudi Shamsabad et al. 2012) with nearly 24 species are respectively large genera in this subfamily in Iran.

The main objective of this study, was to achieve the morphological and anatomical differences through

leaf anatomy and stomata morphology among 11 genera of *Caryophylloideae* (*Acanthophyllum*, *Agrostemma*, *Allocrusa*, *Dianthus*, *Gypsophila*, *Petrorhagia*, *Psammophiliella*, *Saponaria*, *Silene*, *Vaccaria*, and *Velezia*), and also to contribute some useful information for the systematic of these genera.

Materials and Methods

- Anatomical study

In the present study, leaf anatomy of 23 species of eight genera of the subfamily *Caryophylloideae* out of 13 genera in the Flora Iranica area were investigated (Table 1). The sampling strategy was to include the representatives of problematic genera from the perspective of phylogenetic studies (Greenberg & Donoghue 2011, Pirani et al. 2014, Madhani et al. 2018). Where available, more than two species were considered for one genus to ensure certainty about the stability of anatomical characters among different species of a certain genus. The study is based on herbarium specimens of the following herbaria: FAR, T, and TARI. A list of voucher specimens including the source of plant materials as well as collection data is given in table 1. Herbarium abbreviations follow "Index Herbariorum" (Thiers 2016, continuously updated; <http://sweetgum.nybg.org/science/ih/>).

Leaf samples were rehydrated with boiling and fixed in FAA solution (formalin-acetic acid-alcohol: 90:5:5) for 24–36 hours, then preserved in 70% ethanol. Cross sections were made by hand using commercial razor blades. The sections were transferred into 30% sodium hypochlorite solution for about 20 min washed in several changes of water, then transferred into acetic acid 5% for 30–60 seconds and rinsed in water. The sections were double stained with methyl green and brown bismarck colors (Culter et al. 2007).

For stomata studies, leaves were excised from the mid-lamina regions of adaxial and abaxial surface. Paradermal sections were transferred into 30% sodium hypochlorite solution for about one minute and rinsed in water then stained with Fuchsine (Culter et al. 2007).

- Data analysis

Forty-nine characters (Metcalfe & Chalk 1979) (including 16 qualitative and 33 quantitative characters) (Table 2) have been considered. To determine the similarity of examined taxa, the results have been

analyzed by PAUP 4.0b10 software with UPGMA and Neighbor-joining methods. The FigTree Ver. 1.4.2 has been used for drawing the phenograms (Figs 8–9).

23	<i>Velezia rigida</i> L.	Guilan province: Rudbar, Siahrud, Atayi 3701 (T)

Results and Discussion

Transverse sections of leaves are usually u- or v-shape and sometimes plain. The epidermis in both surfaces is composed of one layer of polyhedral, circular or stellate cells, with straight or undulate

anticlinal walls, which are covered by cuticle. Leaves of all examined genera are amphistomatic and stomatal index of adaxial and abaxial sides do not show meaningful differences. The stomata are typically diasytic (Figs 4–7), but there are some exceptions in the

genera *Acanthophyllum*, *Allochrusa*, *Saponaria*, and *Psammophiliella* Ikonn. which their stomatal patterns are more similar to anemocytic pattern (Fig. 5). Mesophyll is centric or dorsiventral, but in the genera *Agrostemma* (Fig. 2 A–B), *Acanthophyllum* (Fig. 1 B–C), *Allochrusa* (Fig. 1 A), *Gypsophila* (Fig. 3 A–H), and *Vaccaria* (Fig. 1 L) merely centric feature has been recognized. In all genera, there are 1–4 layers of palisade parenchyma (at least on one side), and then 1–7 layers of spongy parenchyma depending on the species. Midrib in transverse sections is circular, semicircular or pyriform. Sometimes there are 1–3 (scarcely eight) layers of collenchymatous tissue below the phloem or above the xylem tissue. Most species have parenchymatous bundle sheath (Table 4, Figs 1–3).

According to the phenogram resulting from UPGMA (Fig. 8 A) and Neighbor-joining (Fig. 8 B), all anatomical characteristics are not constant in species of the genera, but some of them such as stomatal patterns, limb symmetry, collenchymatous tissue and layers of fiber around the central vascular bundles may be useful

to separate some genera. It is probable that, a wider sampling would lead to finding a set of features that could more match to the classification based on morphology and phylogeny.

However, none of the phenograms (Fig. 8) show precisely categories corresponding traditional genera, but the resulting phenogram obtained with NJ has categories that are more acceptable. All examined specimens of *Dianthus*, *Velezia*, and *Petrorhagia* are located in one branch, of course it should be mentioned that, *Saponaria viscosa* is in the same branch. Except for *Silene eriocalycina*, the other three species of *Silene* are arranged in one branch. However, *Gypsophila* and *Acanthophyllum* species are scattered in different branches. In fact, the anatomical features of *Gypsophila* species, as well as their morphological characteristics, are diverse. An important feature that seems to have led to the separation of some species from the expected branch is variation in stomatal type found in some species of different genera.

Table 2. Character states and coding

Character (code)	State (code)			
(1) Number of upper collenchyma layers	0 (0)	1 (1)		
(2) Number of lower collenchyma layers	0 (0)	1–3 (1)	8 (2)	
(3) Upper collenchyma type	Absent (0)	Tangential (1)

(49) Stomatal position in lower epidermis	Irregular & scattered (0)	Regular & parallel (1)		

Acanthophyllum and Allochrusa

Recent molecular phylogenetic analyses (Greenberg & Donoghue 2011, Pirani *et al.* 2014) have shown that, *Allochrusa* belongs to a clade together with *Acanthophyllum* and maybe it must be considered as a section of *Acanthophyllum* (Pirani & Rabeler 2017, Madhani *et al.* 2018), but because of significant

morphological differences, such as not being spiny and not having exserted stamens in *Allochrusa*, this genus has been treated as a separate one (Mahmoodi & Nejad Falatoury 2016). Lacking of multiple layers of fiber around the central vascular bundle in *Allochrusa* supports separation of these two genera (Fig. 1 A–C).

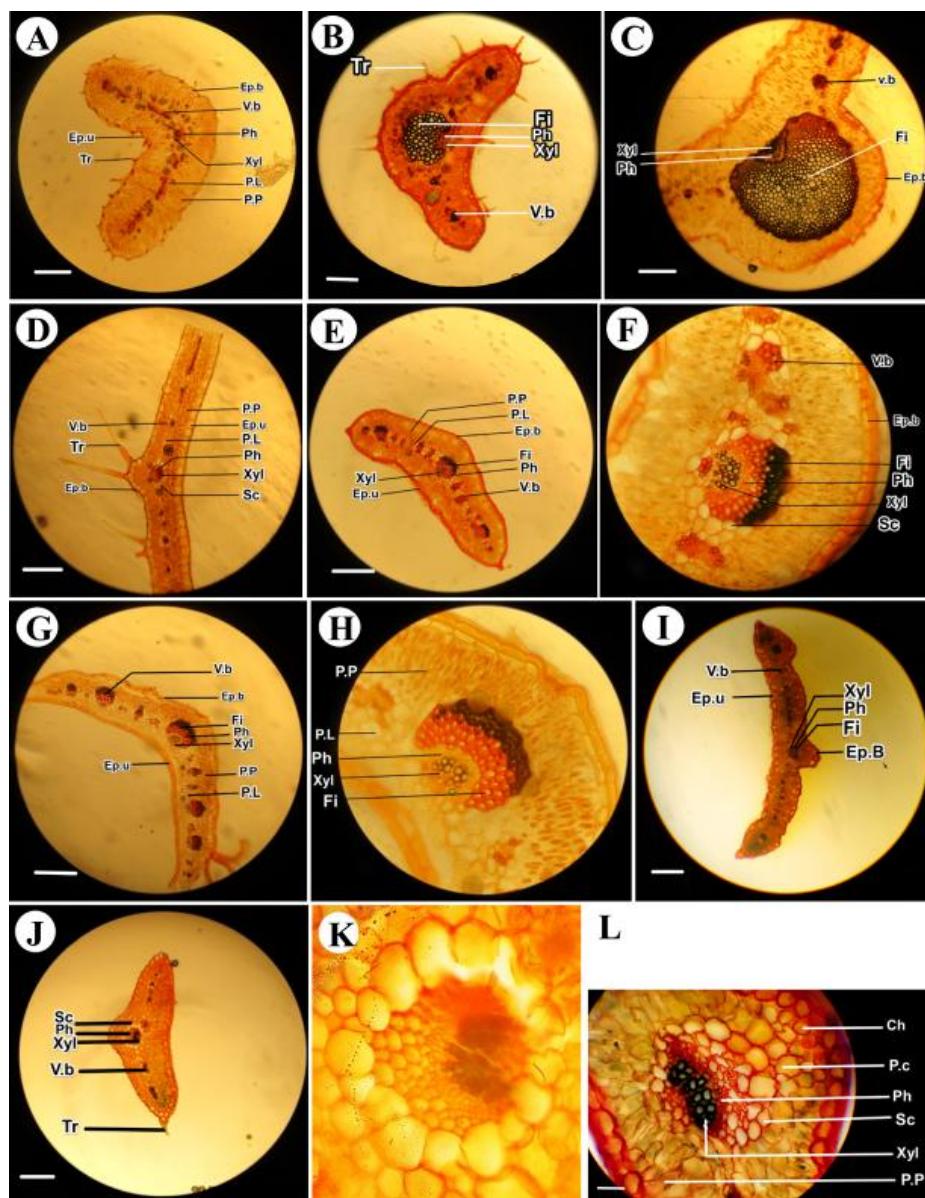

Fig. 1. Transverse sections of leaves: A. *Allochrusa lutea*, B. *Acanthophyllum mucronatum*, C. *A. sordidum* D. *Dianthus armeria*, E, F. *D. crinitus*; G, H. *D. szowitsianus*; I: *Velezia rigida*; J, K. *Petrorhagia saxifraga*; L. *Vaccaria hispanica*. Gypsophila, Saponaria, and Psammophiliella

In recent molecular analyses *Gypsophila muralis* L. resolves as sister to the *Dianthus-Petrorhagia* clade (Greenberg & Donoghue 2011, Pirani *et al.* 2014, Madhani *et al.* 2018), and the remaining species of *Gypsophila* are found in two additional clades. This result as well as morphological diagnostic characters of *G. muralis*, support splitting of this species and its allied taxa including *Gypsophila bellidifolia* Boiss. = *Saponaria barbata* Barkoudah (1962) and *Saponaria esfandiarii* Assadi (1989) as a separate genus sensu Ikonnikov (1976) named as *Psammophiliella* Ikonnikov. Diagnostic morphological characters which split *Psammophiliella* of *Gypsophila* are the narrow hyaline intervals in calyx and elongate stigmatic surface of styles vs. capitate stigma in *Gypsophila* species (Ikonnikov 1976) (Table 3). According to the phenogram resulting from NJ (Fig. 8 B), two examined species of *Psammophiliella* are located in one branch, therefore,

they are common in many anatomical features that support the closeness of these two taxa (Fig. 3 I, K).

Psammophiliella esfandiarii (Assadi) Falat., Assadi & F.Ghahrem. comb. nov.

Basionym: *Saponaria esfandiarii* Assadi, Iran. J. Bot. 4(2): 198 (1989).

Type: Iran: Hormozgan province, ca. 100 km SE of Lar, above the village Sartang, Kuh-e Shab, 500–900 m, 19 April 1983, Assadi & Sardabi 42042 (holotype TARI!).

Specimens examined: *Psammophiliella esfandiarii*: Iran: Hormozgan province, Bandar Abbas, Ghotebad, Baghestan, Damtang village, Baz mt, 500–2000 m, 28 April 1985, Mozaffarian 49988 (TARI); *Psammophiliella bellidifolia*: Bandar-abbas, Bashagard, 42 km from Senderk to Anguhran, between Darpahn and Davari, 750 m, 3 May 1982, Mozaffarian, Banihashemi and Shahinzadeh 39296 (TARI); Bashagard, 62 km from Senderk to Anguhran, close to Jakdan, 700 m, 4 May 1982, Mozaffarian, Banihashemi and Shahinzadeh 39334

(TARI); Bashagard, 105 km from Senderk to Anguhran, between Jakdan and Sardasht, 680–1000 m, 8 May 1983, Mozaffarian 44416 (TARI); Sistan-va-Baluchestan province: 6 km on road from Rask to Iranshahr, 450 m, 9 March 1977, Runemark, Assadi and Sardabi 22540

(TARI), 6 km from Sarbaz to Iranshahr, 1000 m, 17 April 1991, Mozaffarian 70134 (TARI); Chahbahar, Gardanehe Hodar, Rask road, 350 m, 7 March 1974, Foroughi 10734 (TARI).

Table 3. Diagnostic morphological characters of *Psammophiliella* compared with *Saponaria* and *Gypsophila*

Diagnostic character	<i>Saponaria</i>	<i>Psammophiliella</i>	<i>Gypsophila</i>
Stigma	Often elongate	Elongate	Capitate
Calyx shape	Oblong-cylindric, terete	Narrow campanulate to short cylindric	Obconic to campanulate, terete to 5-angled
Calyx hyaline intervals	Absent	Narrow	Distinctive
Petal shape	With distinctive claw	With indistinctive claw	Without claw
Coronal appendages of petals	Often present	Absent	Absent
Flowers	Often integrated at end of stem	Often spreading along the stem	Various

Petrorhagia (Ser.) Link

A new species of *Gypsophila* has been described from Iran as *Gypsophila elymaitica* Mozaff. (Mozaffarian 2008). By studying the type specimen of *G. elymaitica*, we found some characters which did not approve belonging of this specimen to the genus *Gypsophila*. Considering having bracteoles near the calyces, peltate seeds with a facial hilum and straight embryo, this species is not a *Gypsophila* but it belongs to the genus *Petrorhagia*. Thus, a new combination is proposed:

Petrorhagia elymaitica (Mozaff.) Falat., Assadi & F.Ghahrem. **comb. nov.**

Basionym: *Gypsophila elymaitica* Mozaff., Iran. J. Bot. 14(2): 89 (2008)

Type: Iran: Ilam province: Ilam to Darreshahr, Kulm, N. slope of rocky deep gorge of Kabirkuh, S. of Kulm, 23 VIII 2004, V. Mozaffarian 88385 (holotype TARI!). Other examined specimens: Ilam province, Ilam to Darreshahr, Badre, Tange Kafari, 700 m, V. Mozaffarian 88396 (TARI!); Khuzistan: Dehdez, kuh-e Gharoon, from Absefid valley, 1000–1500 m, V. Mozaffarian 74483 (TARI!).

It is worth to mention that, despite the phylogenetic results (Greenberg & Donoghue 2011, Pirani 2014, Madhani et al. 2018), due to the obvious morphological evidences, here, the merging of the genera *Allochrusa* with *Acanthophyllum*; *Velezia* with *Dianthus*; *Ankyropetalum*, *Vaccaria* with *Gypsophila*, and *Agrostemma* with *Silene* were avoided.

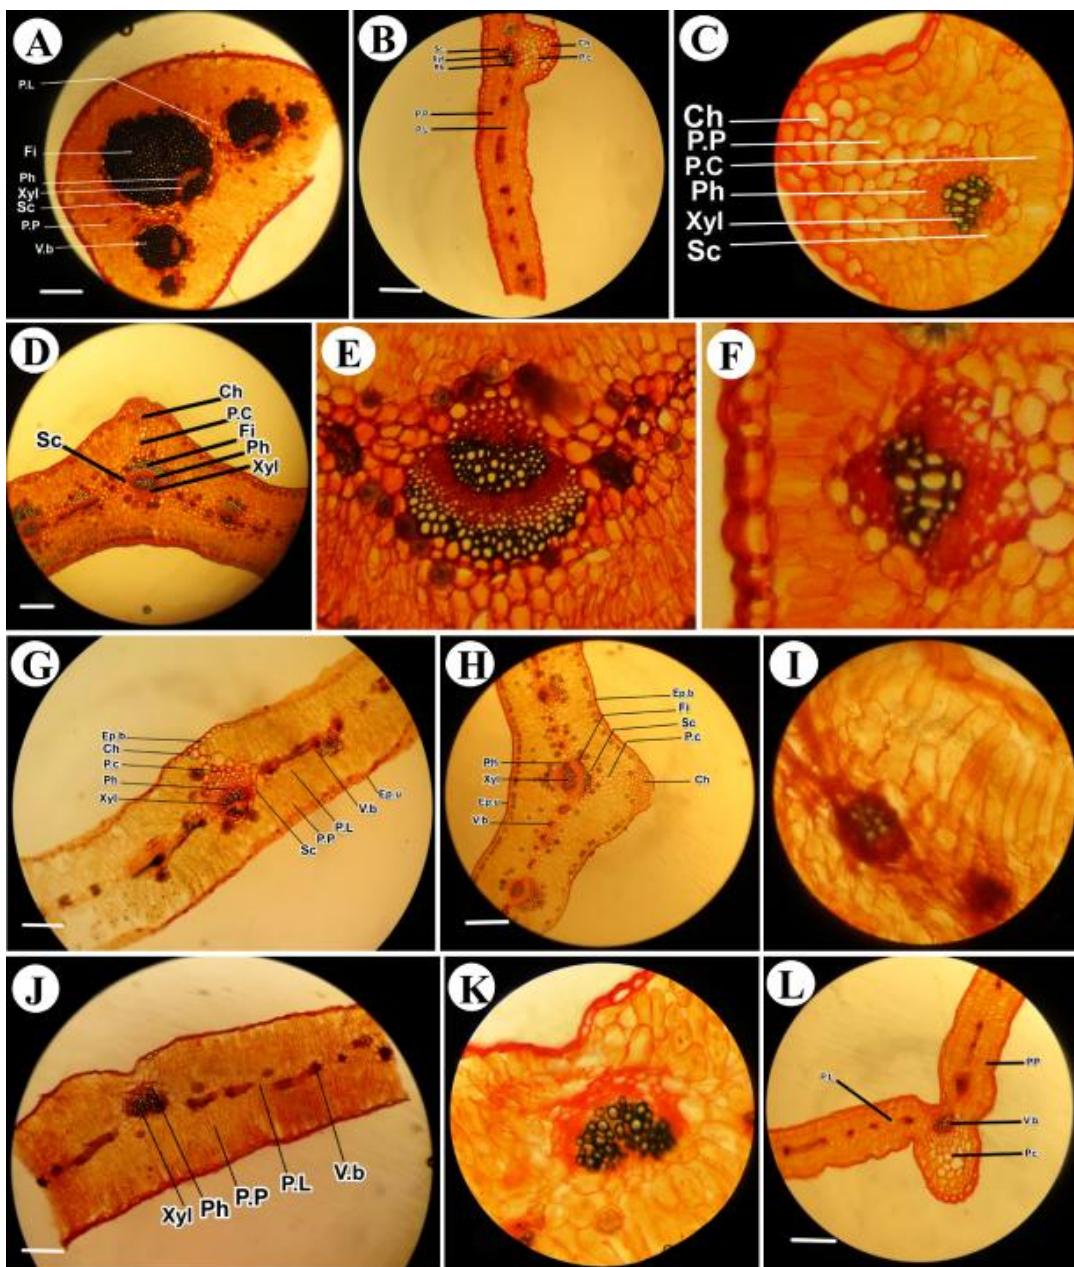

Fig. 3. Transverse sections of leaves: A. *Gypsophila acantholimoides*, B, C. *G. bicolor*, D, E. *G. caricifolia*, F. *G. linearifolia*, G. *G. pallida*, H. *G. pilos*, I. *Psammophiliella bellidifolia*, J, K. *P. esfandiarii*, L. *Saponaria viscosa*. Ch: collenchyma; Ep.b: lower epidermis; Ep.u: upper epidermis; Fi: fibers; Mv: midrib; P.c: paranchyma; Ph: phloem; P.L: spongy paranchyma; P.P: palisade paranchyma; Sc: sclerenchyma; Tr: trichome; V.b: vascular bundle; Xyl: xylem (Bars = 50 μ m).

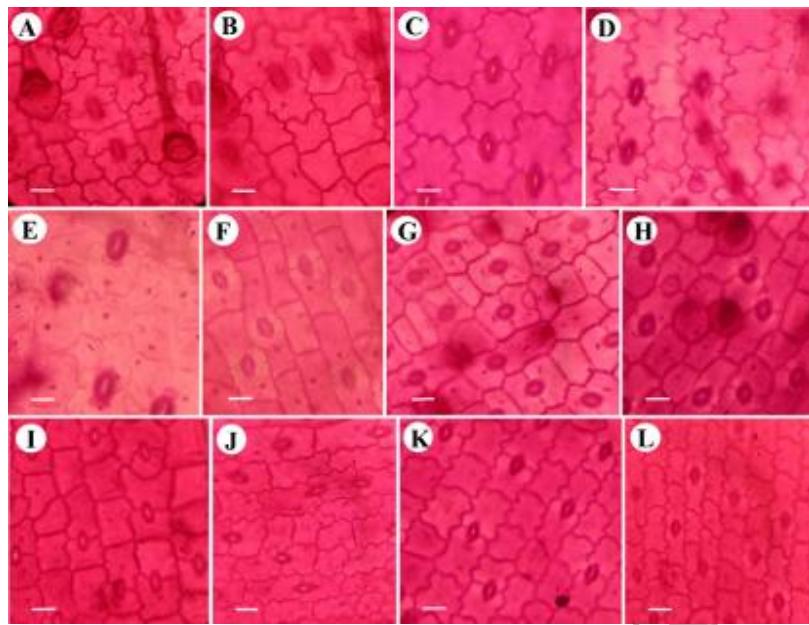

Fig. 4. Epidermis and stomata: A, C, E, G, I & K. Upper epidermis, B, D, F, H, J & L. Lower epidermis, A, B. *Agrostemma githago*, C, D. *Dianthus armeria*, E, F. *D. crinitus*, G, H. *D. szowitsianus*, I, J. *Petrorhagia saxifraga*, K, L. *Velezia rigida* (Bars = 50 μ m).

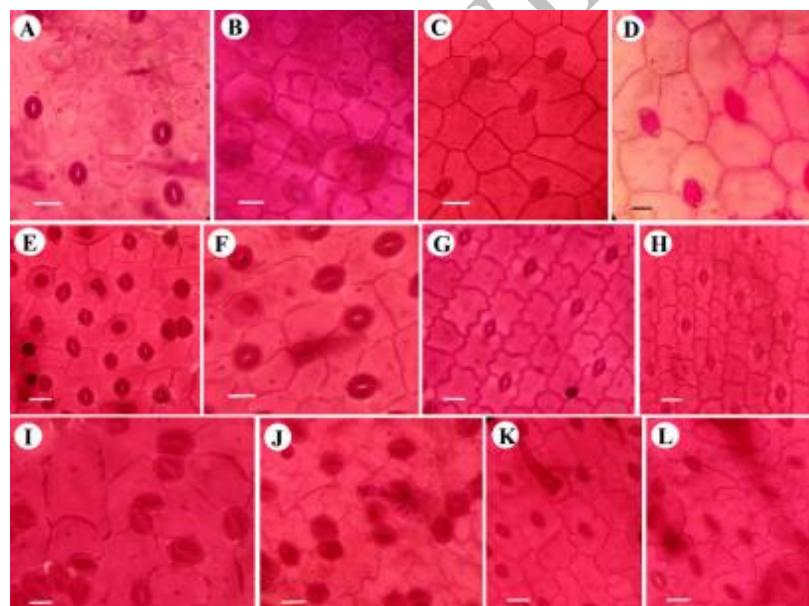

Fig. 5. Epidermis and stomata: A, C, E, G, I & K. Upper epidermis, B, D, F, H, J & L. Lower epidermis, A, B. *Acanthophyllum mucronatum*, C, D. *A. sordidum*, E, F. *Allocrusa lutea*, G, H. *Psammophilella bellidifolia*, I, J. *P. esfandiarii*, K, L. *Saponaria viscosa* (Bars = 50 μ m).

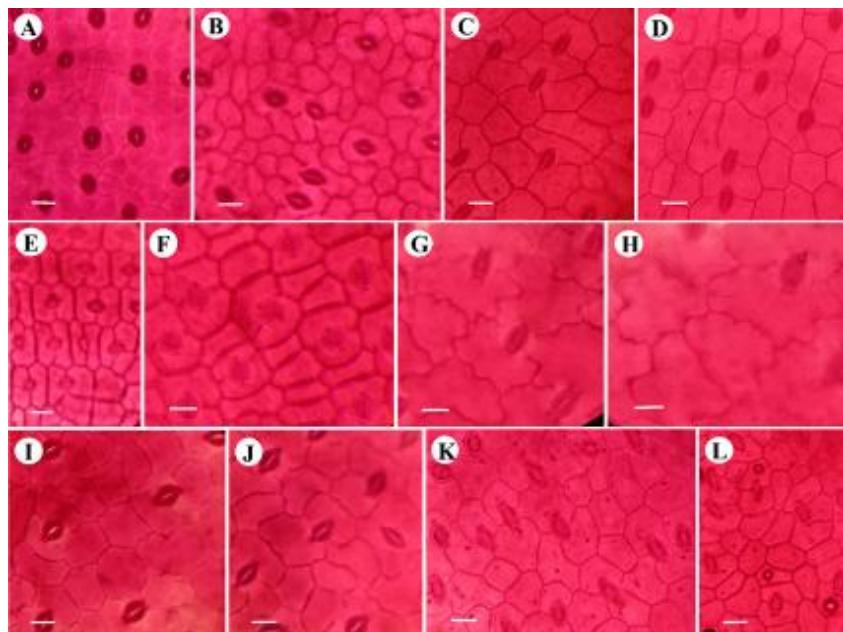

Fig. 6. Epidermis and stomata: A, C, E, G, I & K. Upper epidermis, B, D, F, H, J & L. Lower epidermis, A, B. *Gypsophila acantholimoides*, C, D. *G. bicolor*, E, F. *G. caricifolia*, G, H. *G. linearifolia*, I, J. *G. pallida*, K, L. *G. pilosa* (Bars = 50 µm).

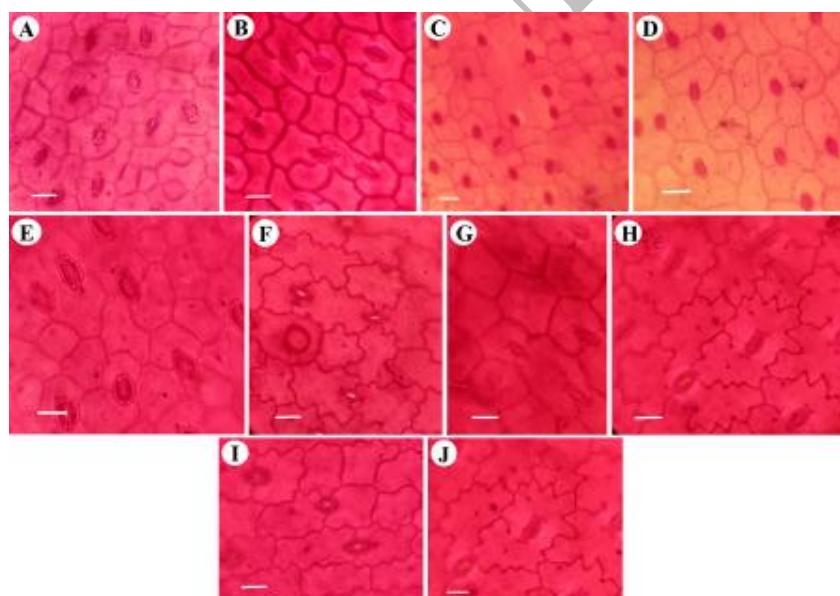

Fig. 7. Epidermis and stomata: A, C, E, G, I & K. Upper epidermis; B, D, F, H, J & L. Lower epidermis. A, B: *Silene bupleuroides*, C, D. *S. eriocalycina*, E, F. *S. latifolia*, G, H. *S. vulgaris*, I, J. *Vaccaria hispanica* (Bars = 50 µm).

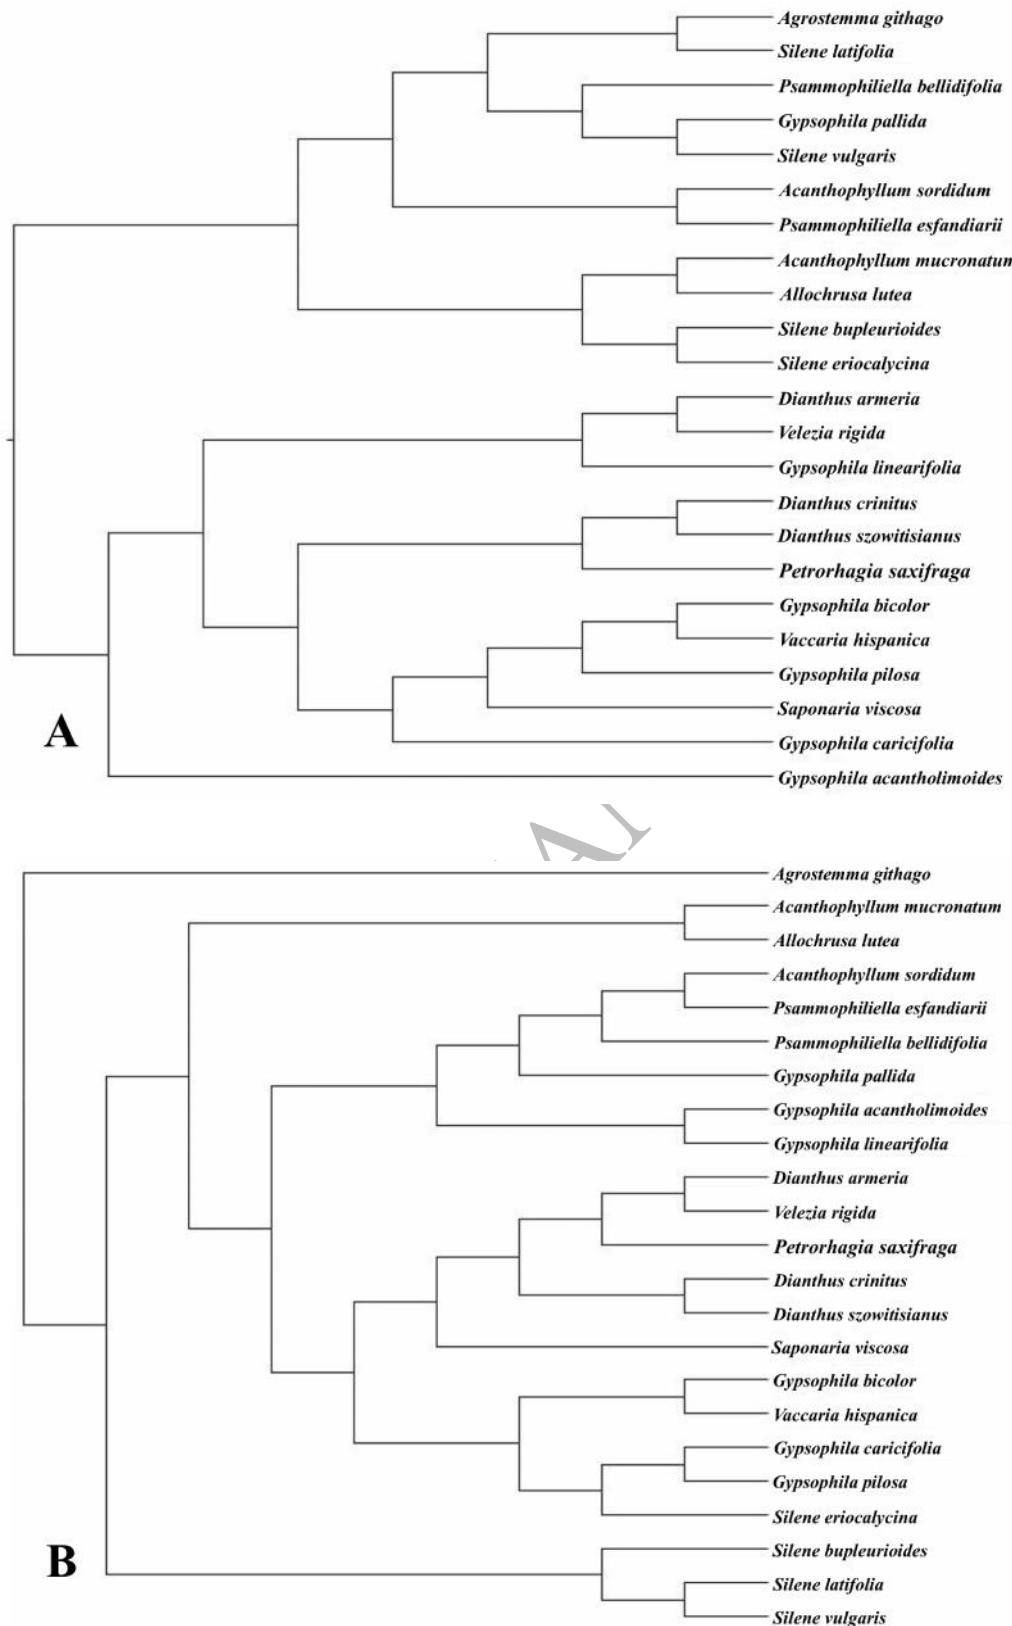

Fig. 8. A. UPGMA phenogram constructed from results of anatomical studies of taxa, B. Neighbor-joining phenogram constructed from results of anatomical studies of taxa.

An updated key for the genera of *Caryophylloideae* in Iran

Due to the addition of *Psammophiliella* to the flora of Iran here, the following simplified key for *Caryophylloideae* is presented based on morphological traits using available sources including Flora Iranica (Rechinger 1988).

1. Calyx with commissural veins.....2
- Calyx without commissural veins.....4
2. Calyx teeth foliaceous, (11-)15–35 mm, exceeding the petals.....*Agrostemma*
- Calyx teeth not foliaceous, less than 10 mm, shorter than the petals.....3
3. Capsule teeth as many as styles; styles 5, flowers hermaphrodite.....*Lychnis*
- Capsule teeth twice as many as styles; styles 3 or if 5 then flowers unisexual.....*Silene*
4. Calyx well developed, with relatively expanded base and tapering at the base of calyx dents.....5
- Calyx not as above.....6
5. Annual plant, calyx with 5 well-developed wings.....*Vaccaria*
- Suffruticose, multi stems, calyx with prominent nerve
6. Calyx without membranous hyaline intervals between the nerves.....7
- Calyx with membranous hyaline intervals between the nerves.....9
7. Bracteoles closely adpressed to calyx.....*Dianthus*
- Bracteoles not adpressed to calyx.....8
8. Seeds peltate with facial hilum; petals without or with small coronal scales.....*Velezia*
- Seeds reniform with lateral hilum; petals with or without coronal scales.....*Saponaria*
9. Seeds peltate with facial hilum.....*Petrorhagia*
- Seeds reniform or comma-shaped, with lateral hilum.....10
10. Fruit 1–4-seeded, indehiscent or rupturing irregularly at base.....11
- Fruit 4–36-seeded, dehiscing by valves or teeth.....13
11. Petals trifid.....*Ankyropetalum*
- Petals at most notched.....12
12. Leaves, bracts and calyx teeth ± spiny; stamens exserted.....*Acanthophyllum*
- Plant not spiny; stamens not exserted.....*Allochrusa*
13. Hyaline intervals distinctive; stigma capitate.....*Gypsophila*
- Narrow hyaline intervals; stigmatic surface along the whole inner side of the styles.....*Psammophiliella*
