Abstract

The hunting-prohibited area of Dorodzan dam is located at Fars province (Iran). The area is about 30,000 hectares and its vascular flora has been studied during 2011–12. In the present study, a total of 1876 plant specimens were collected and 529 taxa, belonging to 345 genera and 76 families were identified. The life form rates of the taxa are as follows: therophytes (40.6%), hemicryptophytes (30.92%), cryptophytes (13.47%), chamaephytes (8.91%), and phanerophytes (6.07%), respectively. Large families in terms of number of genera and species are Asteraceae (76 species), Fabaceae (48 species), Poaceae (45 species), Lamiaceae (38 species), Brassicaceae (27 species), Apiaceae (24 species), Caryophyllaceae (21 species), and Boraginaceae (17 species). The richest genera are Astragalus (21 species) Cousinia, Centaurea, Euphorbia, Scorzonera, and Silene (seven species each), Allium, Cyperus, and Nepeta (six species each). Among biogeographical regions, the main phytogeographical affinity of the species, was Irano-Turanian (55.59%). In addition, 80 taxa (15.12%) were considered as endemic to Iran.

خلاصه

منطقه شکار ممنوع سد درودزن در استان فارس قرار دارد. مساحت این منطقه حدود ۳۰۰۰۰ هکتار مربوط است و فلور آن بین سال‌های ۱۳۸۹–۹۰ مطالعه گردید. در این مطالعه جمعاً ۱۸۷۶ نمونه گیاهی، متعلق به ۵۲۹ آرایه شامل ۳۴۵ جنس و ۷۶ تیره بررسی گردید. طیف شکل‌های زیستی به صورت یک‌ساله (۴۰/۶٪)، همی‌کریپتووفیت (۳۰/۹٪)، ژئوفیت (۱۳/۴٪)، کامهوفیت (۸/۹٪) و فلاروفیت (۶/۰٪) تقسیم‌بندی شدند. تیره‌های بزرگ براساس تعداد آرایه عبارت بودند از کاسنیان (۴۸ گونه)، باقلاییان (۴۸ گونه)، چمنیان (۴۵ گونه)، نعناعیان (۳۸ گونه)، کلمیان (۲۶ گونه)، چتریان (۲۳ گونه)، میخکیان (۲۱ گونه) و گاوزبانان (۱۷ گونه). جنس‌های با گونه‌های پرشمار شامل گون (۲۱ گونه)، هزارخار، گل‌گندم، فرفیون، شنگ اسبی و مگس‌گیر (هر کدام هفت گونه)، پیاز، اویارسلام و پونه‌سا (هر کدام شش گونه) بودند. عناصر ایرانو-تورانی با در برداشتن (۵۵/۵٪)، عمده‌ترین نوع پراکنش جغرافیایی منطقه را به خود اختصاص دادند. همچنین، ۸۰ آرایه (۱۵/۱٪) انحصاری ایران درنظر گرفته شد.

واژه‌های کلیدی: فارس، فلور، فرم زیستی، مرودشت، منطقه شکار ممنوع

Introduction

Iran, with approximately 8100 plant species (Ghahremanejad *et al.* 2017), is one of the centers of diversity and morphological variation in some genera and families. The high species richness is correlated with geographic and habitat diversity influenced by three biogeographical regions, i.e. the Irano-Turanian, Euro-Siberian, and Saharo-Sindian (Zohary 1973). The mountains and foothills of Zagros belong to the Irano-Turanian region. The mountains are divided to three parts and begins in NW Iran and extend the whole length of the western, and SW Iranian plateau ultimately terminates at the Strait of Hormoz (Persian Gulf). Most of the habitats in the Zagros mountains are covered by pure or mixed stands of open xerophytic cold-resistant deciduous oak woodlands. The woodlands grow together with many plants such as *Prunus*, *Pistacia*, *Cretageus*, *Pyrus*, *Fraxinus*, and *Acer* (Sagheb Talebi *et al.* 2013). The Central Zagros, with ca. 2.5 million hectares, includes main part of Chaharmahal and Bakhtiari, Kohgiluyeh and Boyer-Ahmad, Fars (Eqlid and Marvdasht), and Esfahan (Semirum) provinces (Fig. 1). The region with more than 2000 plant species comprises of most valuable Zagros mountains elements as hotspot of biological diversity in Anatolian-Iranian area (Zehzad *et al.* 2017). Zagros mountains region is considered to be one of the origins of agricultural and horticultural activities in the world (Sheikh-Hassani *et al.* 2011, Ghahremanejad *et al.* 2021). The suggested hunting-prohibited area of Dorodzan dam mainly consists of mountainous habitat located at Central Zagros including Dorodzan dam (previously called Sang-e Dokhtaran or Darius dam). The area with 30,000 hectares is located at NW Marvdasht (Persepolis), at the north of Fars province between 30° 4'–30° 19' N, 52° 13'–52° 35' E. The nearest cities to the area

are Marvdasht at 43 km NW, Sepidan (Ardakan) at 52 km W, Shiraz, and Sadra at 74 km and 58 N from the study area, respectively (Fig. 2). The area is placed in Mediterranean pluviseasonal-continental (Djamali *et al.* 2011), with the highest precipitation from late autumn to early spring with a summer drought. The difference in altitude between the lowest area (ca. 1620 m) in southern and eastern parts and the highest area in the northern mountain (ca. 2645 m a.s.l.) is about 1025 m a.s.l.

More information on the flora of Zagros is helpful for future studies such as migration and delimitation of phytogeographical groups. Moreover, with increasing finding of new species in the Central Zagros (e.g., Lidén 2007, Zeraatkar *et al.* 2016, Al-Shehbaz 2017), the data are needed to improve objectivity in assessing the conservation status of the species.

Materials and Methods

A total of 1876 plant specimens were collected from the area, during 2011–12. The exact coordinates and elevation of collection sites were recorded by a commercial GPS (Garmin). The plants were dried and consequently labeled for providing herbarium specimens. Nomenclature of the vascular plants is based on APG IV (2016), except *Chenopodiaceae* following Hernández-Ledesma *et al.* (2015). The chorology and identification of species are mainly determined using distribution data in relevant Floras and literatures e.g., Rechinger (1963–2015), Assadi *et al.* (1988–2021), and Townsend *et al.* (1966–88). The life forms were classified according to Raunkiaer (1934). The voucher specimens are deposited at the Tehran herbarium (T), Shiraz University herbarium (HSHU), and Chaharmahal and Bakhtiari Agricultural and Natural Resources Research and Education Center (D) (Table 3) (Herbarium acronyms follows Thier 2021+).

Fig. 1. Position of the studied area in Central Zagros marked with an asterisk (adapted from Zehzad et al. 2017).

Fig. 2. Location of the studied area in Fars province and Iran (red boundaries show map of the studied area).

Results

Five hundred, twenty-nine plant taxa were collected from the study area, which belong to 345 genera and 76 families (Table 3). Angiosperms include dicots with 434 species, 276 genera, and 59 families followed by monocots with 90 species, 60 genera, and 15 families. Gymnosperms embrace two species, one genus, and one family while pteridophytes are represented by five species, four genera, and four families. Large families in terms of number of genera and species are *Asteraceae* (76 species), *Fabaceae* (48 species), *Poaceae* (45 species), *Lamiaceae* (38 species), *Brassicaceae* (27 species), *Apiaceae* (24 species), *Caryophyllaceae* (21 species), and *Boraginaceae* (17 species) (Table 1). *Astragalus* (21

species), *Cousinia*, *Centaurea*, *Euphorbia*, *Scorzonera*, and *Silene* (seven species each), *Allium*, *Cyperus*, *Acantholimon*, and *Nepeta* (six species each) are among the most species-rich ones (Table 2). Life form spectrum of the area is dominated by therophytes (40.6%) and hemicryptophytes (30.92%) followed by cryptophytes (13.47%), chamaephytes (8.91%), and phanerophytes (6.07%). The chorological affinities of species were as follows: Irano-Turanian (55.59%), Irano-Turanian and Mediterranean (9.67%), Irano-Turanian, Euro-Siberian & Mediterranean (7.5%), Irano-Turanian & Sahara-Sindian (6.45%), pluriregional- more than three regions (6.07%), cosmopolite (5.12%), and Irano-Turanian & Euro-Siberian (4.17%) (Fig. 3).

Table 1. List of the most species-rich vascular plant families in the area

Family	No. of genera	No. of species
<i>Asteraceae</i>	47	76
<i>Fabaceae</i>	15	48
<i>Poaceae</i>	33	45
<i>Lamiaceae</i>	17	38
<i>Brassicaceae</i>	23	26
<i>Apiaceae</i>	19	23
<i>Caryophyllaceae</i>	12	21
<i>Boraginaceae</i>	12	17

Table 2. List of richest vascular plant genera in the area

Genus	No. of species	Genus	No. of species
<i>Astragalus</i>	21	<i>Amaranthus</i>	4
<i>Cousinia</i>	7	<i>Bromus</i>	4
<i>Euphorbia</i>	7	<i>Convolvulus</i>	4
<i>Scorzonera</i>	7	<i>Echinops</i>	4
<i>Silene</i>	7	<i>Salvia</i>	4
<i>Allium</i>	6	<i>Medicago</i>	4
<i>Cyperus</i>	6	<i>Papaver</i>	4
<i>Nepeta</i>	6	<i>Phlomis</i>	4
<i>Plantago</i>	5	<i>Ziziphora</i>	4
<i>Polygonum</i>	5	<i>Fritillaria</i>	4

Discussion

High plant diversity within a limited area is due to many factors mainly because of the biogeographic position of the area. The area is located at the end of Central Zagros adjacent to Southern Zagros (Fig. 1). Most the plant records belong to the eastern and southern areas while reports from the central, western as well as northern parts are still awaited. In addition, weedy and ruderal species around fields, villages, Kor River margin, and the lake margin have increased the plant species richness of the area.

The high percentage of therophytes (214 species, 40.6%), and hemicryptophytes (163 species, 30.92%) demonstrates the adaptation of the plants to fields and arid habitats through annually completing their life cycle and avoid harsh winter, respectively. However, most of the annual plants related to ruderal species in foothills have adverse effects on the diversity. Also, there are distinct diverse about the phanerophyte in the area. The main vegetation of the area is characterized by open shrublands viz. *Prunus scoparia* (Spach) C.K. Schneid., growing together with *Acer monspessulanum* L. subsp. *persicum* (Pojark.) Rech.f., *Crataegus aronia* (L.) Bosc. ex DC., *Ficus* spp., *Fraxinus rotundifolia* subsp. *persica* (Boiss.) Azadi, *Pistacia* spp., *Prunus elaeagnifolia* C.K. Schneider, *P. microcarpa* (Boiss. & Hausskn.) Schneider, *Convolvulus leiocalycinus* Boiss., *Rhamnus pallasii* Fisch. & C.A. Mey. subsp. *iranica* (Hausskn. in Bornm.) Browicz & J. Zielinski, *Daphne mucronata* Royle., and *Lonicera nummulariifolia* Jaub. & Spach whereas the

most western part partly contains *Quercus brantii* in margins and high altitudes mixed with *Acer monspessulanum* subsp. *persicum*, *Phlomis elliptica* Benth., *Prunus elaeagnifolia*, *P. scoparia*, *Pistacia atlantica* Desf., and *Daphne mucronata* (Figs 4 & 5). The semi-dense shrublands are replaced by very scattered scrubs e.g., *Prunus eburnea* (Spach) Aitch., *P. lycioides* (Spach) C.K. Schneid., *Ficus carica* L., and *Convolvulus leiocalycinus* along with thorn-cushion formations in the south area where it is close to southern Zagros flora (Fig. 5). Except for a very small and interesting patch in Kuh Khersi hunting-prohibited area (between Darreh Bad and Galeh Zan villages), no other woodlands of *Qurequs brantii* occur in east of the area. The patch represents the easternmost station of *Q. brantii* for the total range of *Q. brantii* in Iran (Fig. 2).

The presence of small patch of *Prunus scoparia* community in the eastern area (known as Cham-e Smaael, between Hesamabad and Jeshnian villages), and also presence of the same communities in foothills of Kuh Khersi hunting-prohibited area attached to trees and shrubby vegetations, have been dominated the plains in the past. The shrubs and subshrubs viz. *Convolvulus leiocalycinus*, *Acer monspessulanum* subsp. *persicum*, *Prunus elaeagnifolia*, *P. microcarpa*, *P. scoparia*, *Pistacia atlantica*, *Rhamnus pallasii*, and *Lonicera nummulariifolia* together with some thorn-cushion formations e.g., *Astragalus rhodosemius* Boiss. & Hausskn., *A. myriacanthus* Boiss., and *Acantholimon asphodelinum* Mobayen occur in foothills to the

uppermost elevation zones of the area, while *Prunus eburnea*, *P. lycioides*, *Crataegus aronia*, *Ficus* spp., *Acantholimon flexuosum* Boiss. & Hausskn., and *A. festucaceum* (Jaub. & Spach) Boiss. are limited to the foothills (1620–1770 m a.s.l.).

Astragalus adscendens Boiss. & Hausskn., *Brossardia papyracea* Boiss., and *Dorema aucheri* Boiss. that are common in highlands of Fars province were observed in small patches of Mount Zaneh peak (2400–2645 m a.s.l.). The peak is also a dominant in subalpine umbelliferous vegetation [e.g., *Prangos ferulacea* (L.) Lindl.].

The floristic composition of the area shows dominance of the *Asteraceae*, *Fabaceae*, and *Poaceae* families, and some genera such as *Astragalus*, *Cousinia*, *Centaurea*, *Euphorbia*, *Scorzonera*, *Acantholimon*, *Silene*, and *Allium* which are typical of Iranian floras including several xerophytic taxa. Eighty taxa (15.12%) are endemic to Iran. Most endemic species are chasmophytes listed in genera with a high number of endemic species within the Iranian flora (e.g., *Dionysia*, *Acantholimon*, *Scrophularia*, *Nepeta*, *Astragalus*, *Silene*, and *Echinops* (Jalili & Jamzad 1999). Some of the endemic species viz. *Satureja bachtiarica* Bunge, *Alcea laxiflora* Riedl., *Dorema*

aucheri Boiss., and *Allium jesdianum* Boiss. are harvested as edible and medicinal plants.

narrow endemic species such as *Verbascum austroiranicum* Hub.-Mor, *Crataegus persica* A. Pojark., *Silene persepolitana* Melzh., *Campanula perspolitana* Ky. in Boiss., *Hyoscyamus bornmuelleri* Khatamsaz, and *Astragalus penetratus* Maassoumi have fairly distributed in the area that already reported few times. In addition, there are no other reports of new species except for those recently discovered in the area (Tavakkoli et al. 2014, Ranjbar et al. 2017, Assadi & Zeraatkar 2020, Zeraatkar & Ghahremaninejad 2020).

The whole region as well as the Kuh Khersi hunting-prohibited area, have attractive and rich floras in Dorodzan area. There are also some important habitats of the largest carnivorous mammal in Iran such as brown bear. Unfortunately, not only overgrazing takes place in the two areas but also fire, road construction, mining, oak woodlands and almonds diseases, gathering medicinal and edible species, extending the agricultural fields, are among the main threats to the biodiversity of the area.
